2024 Water Quality Report for Village of Vermontville

Water Supply Serial Number: MI0006790

This report covers the drinking water quality for the Village of Vermontville for the 2024 calendar year. This information is a snapshot of the quality of the water that we provided to you in 2024. Included are details about where your water comes from, what it contains, and how it compares to United States Environmental Protection Agency (U.S. EPA) and state standards.

Your water comes from 3 groundwater wells, each over 130' Deep. The State performed an assessment of our source water to determine the susceptibility or the relative potential of contamination. The susceptibility rating is on a seven-tiered scale from "very-low" to "very-high" based on geologic sensitivity, well construction, water chemistry and contamination sources. The susceptibility of our source is Very Low at all 3 Well sites.

There are no significant sources of contamination in our water supply. We are making efforts to protect our sources by maintaining a strict wellhead protection program to protect our wells and well fields.

If you would like to know more about this report, please contact: Christopher Rumsey Village of Vermontville DPW supervisor 517-726-1444.

Contaminants and their presence in water: Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the U.S. EPA's Safe Drinking Water Hotline (800-426-4791).

Vulnerability of sub-populations: Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune systems disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. U.S. EPA/Center for

Disease Control guidelines on appropriate means to lessen the risk of infection by Cryptosporidium and other microbial contaminants are available from the Safe Drinking Water Hotline (800-426-4791).

Sources of drinking water: The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. Our water comes from wells. As water travels over the surface of the land or through the ground, it dissolves naturally occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity.

Contaminants that may be present in source water include:

- Microbial contaminants, such as viruses and bacteria, which may come from sewage treatment plants, septic systems, agricultural livestock operations and wildlife.
- Inorganic contaminants, such as salts and metals, which can be naturally occurring or result from urban stormwater runoff, industrial or domestic wastewater discharges, oil and gas production, mining or farming.
- Pesticides and herbicides, which may come from a variety of sources such as agriculture and residential uses.
- Radioactive contaminants, which can be naturally occurring or be the result of oil and gas production and mining activities.
- Organic chemical contaminants, including synthetic and volatile organic chemicals, which are by-products of industrial processes and petroleum production, and can also come from gas stations, urban stormwater runoff, and septic systems.

In order to ensure that tap water is safe to drink, the U.S. EPA prescribes regulations that limit the levels of certain contaminants in water provided by public water systems.

Federal Food and Drug Administration regulations establish limits for contaminants in bottled water which provide the same protection for public health.

Water Quality Data

The table below lists all the drinking water contaminants that we detected during the 2024 calendar year. The presence of these contaminants in the water does not necessarily indicate that the water poses a health risk. Unless otherwise noted, the data presented in this table is from testing done January 1 through December 31, 2024. The State allows us to monitor for certain contaminants less than once per year because the concentrations of these contaminants are not expected to vary significantly from year to year. All the data is representative of the water quality, but some are more than one year old.

Terms and abbreviations used below:

- <u>Maximum Contaminant Level Goal (MCLG)</u>: The level of contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.
- <u>Maximum Contaminant Level (MCL)</u>: The highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology.
- <u>Maximum Residual Disinfectant Level (MRDL)</u>: The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.
- Maximum Residual Disinfectant Level Goal (MRDLG): The level of a drinking water disinfectant below which there is
 no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control
 microbial contaminants.
- N/A: Not applicable
- ND: not detectable at testing limit
- ppm: parts per million or milligrams per liter
- ppb: parts per billion or micrograms per liter
- ppt: parts per trillion or nanograms per liter
- <u>Action Level (AL)</u>: The concentration of a contaminant which, if exceeded, triggers treatment or other requirements that a water system must follow.

1Monitoring Data for Regulated Contaminants

Regulated Contaminant		MCL, TT, or MRDL	MCLG or MRDLG	Level Detected	Range	Year Sampled	Violation Yes/No	Typical Source of Contaminant
Nitrate (ppm)	12	10	10	ND	0-2.0	2024	NO	Runoff from fertilizer use; Leaching from septic tanks, sewage; Erosion of natural deposits
Fluoride (ppm)	4		4	.20	0-0.2	2023	NO	Erosion of natural deposits; Water additive which promotes strong teeth; Discharge from fertilizer and aluminum factories
Sodium¹ (ppm)	7	N/A	N/A	27	6-27	2023	NO	Erosion of natural deposits
TTHM Total Trihalomethanes (ppb)	hanes (ppb) 80		N/A	29	N/A	2024	NO	Byproduct of drinking water disinfection
HAA5 Haloacetic Acids (ppb)		60	N/A	0.00584	N/A	2024	NO	Byproduct of drinking water disinfection
Chlorine ² (ppm)	4		4	1.09	0.36- 1.53	2024	NO	Water additive used to control microbes
(L. 10.17)								F.O.E.1

¹ Sodium is not a regulated contaminant.

 $^{^{\}mathrm{2}}$ The chlorine "Level Detected" was calculated using a running annual average.

Per- and polytiuoroalkyl substances (PFAS)	s (PFAS)						
Regulated Contaminant	MCL, TT, or MRDL	MCLG or MRDLG	Level Detected	Range	Year Sampled	Violation Yes/No	Typical Source of Contaminant
Perfluorobutane sulfonic acid	420	N/A	٥	2	707/	Ö	Discharge and waste from industrial
(PFBS) (ppt)	150	2	4	/	4202	Č	facilities; stain-resistant treatments
Perfluorohexane sulfonic acid	л	N/N	7	7	VCOC	S	Firefighting foam; discharge and waste
(PFHxS) (ppt)	C F	2	6	/	4707	Z	from industrial facilities
Perfluorohexanoic acid (PFHxA)	A00 000	N /A	2	5	700	5	Firefighting foam; discharge and waste
(ppt)	400,000	N	/	^	2024	N	from industrial facilities
Perfluorononanoic acid (PFNA)	ת	N / /	۵	7	7007	S	Discharge and waste from industrial
(ppt)	c	3	/	/	4707	Z	facilities; breakdown of precursor compounds
Perfluorooctane sulfonic acid	16	N/A	\$	Ĉ.	2024	O	Firefighting foam; discharge from electroplating facilities: discharge and waste
(PPOS) (ppu)							from industrial facilities
Perfluorooctanoic acid (PFOA) (nnt)	x	N/A	<i>S</i>	5	2024	O O	Discharge and waste from industrial
	(14/14	ŕ	ŕ	1707	Č	facilities; stain-resistant treatments
Inorganic Contaminant Subject to Action Levels (AL)	Action Level	MCLG	Your Water ³	Range of Results	Year Sampled	Number of Samples Above AL	Typical Source of Contaminant
Lead (ppb)	15	0	2 ppb	0-6 ppb	2024	0	Lead service lines, corrosion of household plumbing including fittings and fixtures; Erosion of
Copper (ppm)	1.3	1.3	1.2ppm	0-1.2	2024	0	Corrosion of household plumbing systems;
				7			riosion of flacular deposits

 $^{^3}$ Ninety (90) percent of the samples collected were at or below the level reported for our water.

Information about lead: Lead can cause serious health effects in people of all ages, especially pregnant people, infants (both formula-fed and breastfed), and young children. Lead in drinking water is primarily from materials and parts used in service lines and in home plumbing. The Village of Vermontville is responsible for providing high quality drinking water and removing lead pipes but cannot control the variety of materials used in the plumbing in your home. Because lead levels may vary over time, lead exposure is possible even when your tap sampling results do not detect lead at one point in time. You can help protect yourself and your family by identifying and removing lead materials within your home plumbing and taking steps to reduce your family's risk. Using a filter, certified by an American National Standards Institute accredited certifier to reduce lead, is effective in reducing lead exposures. Follow the instructions provided with the filter to ensure the filter is used properly. Use only cold water for drinking, cooking, and making baby formula. Boiling water does not remove lead from water. Before using tap water for drinking, cooking, or making baby formula, flush your pipes for several minutes. You can do this by running your tap, taking a shower, doing laundry or a load of dishes. If you have a lead service line or galvanized requiring replacement service line, you may need to flush your pipes for at least 5 minutes to flush water from both your home plumbing and the lead service line. If you are concerned about lead in your water and wish to have your water tested, contact Village of Vermontville 517-726-1444 for available resources. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available at https://www.epa.gov/safewater/lead.

Reporting Requirements Not Met for Village of Vermontville

We are required to report the results of your drinking water for specific contaminants on a regular basis. Results of regular monitoring are an indicator of whether or not your drinking water meets health standards. While we collected our monthly total coliform sample on time, we did not report the results to the Michigan Department of Environment, Great Lakes, and Energy (EGLE) by December 10, 2024, deadline for the December 1 to December 31, 2024, compliance period.

What should I do?

There is nothing you need to do at this time. This is not an emergency. You do not need to boil water or use an alternative source of water at this time. The results of the sample were negative for bacteria. Even though public health was not impacted, as our customers you have a right to know what happened and what we did to correct the situation.

What happened? What was done?

While we collected the sample on time, we inadvertently missed reporting the sample results to EGLE by the required deadline. We are required to monitor total coliform by collecting one sample per month. We collected the required sample on December 10, 2024, but failed to report the result until January 31, 2025. We are making efforts to ensure this does not happen again. We have already returned to compliance.
